

Professional Model Infill Depth Gauge Instructions

Professional Model Infill Depth Gauge - IDG1-M
Measures from 0 to 2 inches or 0 to 50 mm
Aluminum and Stainless Steel construction
Weight - 8.5 oz

Instructions

1. Place bottom aluminum foot plate firmly on infill surface
2. Slide black center shaft down until three stainless steel spikes make firm contact with carpet backing
3. Lift out and read gauge in inches or millimeters
4. Note, you should check 2 or 3 areas at each location to get the average infill for that test area.
5. Test wear areas more frequently as these areas are usually where the infill is dispersed more frequently.

Also keep in mind that infill does not break down, it often is just re-distributed to other areas of the playing surface. Proper grooming may even out the infill better than the addition of more infill.
